

Model 49 Butterfly Valve Opening and Closing Stop Adjustment

2-1/2" – 10" Sizes

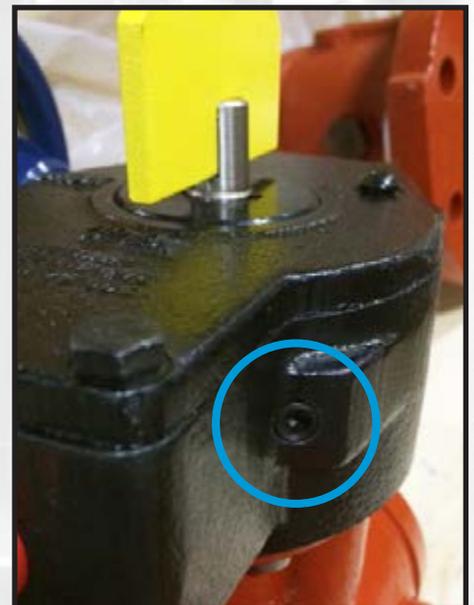

The Zurn Wilkins brand butterfly valves can be adjusted in the field. A 3/16" allen key is needed for 2-1/2" - 6" and a 7/32" allen key for 8" - 10". There are set screws in the back of the actuator housing that adjust the location of the Opening and Closing Stops. There are two set screws at each location. The first set screw must be removed in order to access the second set screw deeper in the hole that provides the adjustment. Backing the second set screw out allows the valve disc to rotate further, toward the Stop being adjusted. Care should be taken to ensure the Stops are not adjusted in such a manner that would allow the valve disc to over travel past the fully open or fully closed positions. Once adjusted, the first set screw should be reinstalled to lock the second set screw in place.
